Master the basics of Dental Histology, Anatomy, Embryology and Physiology. Fundamentals of Oral Anatomy, Physiology and Histology comprises of four units: Oral Histology, Oral Anatomy, General Embryology and Oral

Physiology sections elaborating essential concepts in altogether 38 chapters. Oral Histology emphasizes on the morphology and variation of teeth as a part of dental anatomy. The dental histology section describes the development of teeth and associated tissues including enamel, dentin, pulp, cementum and periodontal ligament. Salivary glands, oral mucosa, maxillary sinus, temporomandibular joint and tissue preparation comprise the rest of the second unit, Oral Anatomy. The third unit of Embryology explains the development of the oral and paraoral structures with details of general embryology from fertilization onwards. Physiology is

the fourth unit which constitutes important topics related to year one of dentistry that include mastication, chewing cycle, saliva and calcium phosphorous metabolism. - Conforms to the syllabi prescribed by DCI - Offers an easy-to-follow format for each chapter with numerous tables, flowcharts, photos, and simple neatly labelled line diagrams and histomicrographs - Summarizes important take away points under Synopsis in each chapter - Provided Review Questions in each chapter for self-appraisal - Hand drawn histology diagrams

Orban's Oral Histology & Embryology - E-BOOK Springer Nature

The present world population of about five billion and its projected growth create enormous pressures and demands for food and industrial raw materials. It is to crop plants, one of our precious few renewable resources, that we must look to meet most of these needs. Globally, about 88% of our caloric

requirements and 90% of our protein ultimately derive from plant sources-ample evidence of their importance to humankind. Our survival will therefore continue to depend on the world's largest and certainly most important industry: agriculture. Yet in spite of our long history of domestication and civilization, the number of crop species involved in sustaining human life is strictly limited: Essentially, some twenty-four crops protect us from starvation. To know these basic food crop plants-to study how they function and how their productivity may be improved--is the first step in solving the world food problem. The primary objectives in writing this book

were to address this challenge and to review comprehensively the wealth of available yet scattered information on food crop productivity and processing. Unlike several other texts and monographs in this field, the present work was intended to give, in a single volume, a quick, informative view of the various problems from field to table concerning the major food crops worldwide.

The fourth edition of this book has been thoroughly updated and revised in accordance with the competency-based curriculum of Pathology. It has been

structured in question-answer format that incorporates information in a concise manner with bulleted points for rapid review and easy recapitulation. This is an endeavour to make understanding of Pathology easier so as to facilitate learning by students and help them apply their knowledge to the problems they encounter in their clinical practice later in life. This edition is based on Robbins & Cotran, Pathologic Basis of Disease, 10th edition. • Covers questions that are commonly/frequently asked in major universities. • Covers all “must know topics in a very simple language and easily comprehensible style. • Organized in small

paragraphs and bulleted points to help in rapid revision before examination. • Tabulation of contrasting features of morphologically similar conditions for further clarification of concepts. • Text enriched with flowcharts explaining mechanism of evolution of disease. • Special emphasis has been laid on clinical presentation (symptoms and signs) and understanding the evolution of disease. • Prioritization of laboratory investigations has been stressed upon in order to provide an integrated approach to the study of pathology and to strengthen the clinical decision-making ability. The production of this manual is a joint activity between the Climate, Energy and Tenure Division (NRC) and the Technologies and practices for smallholder farmers (TECA) Team from the Research and Extension Division (DDNR) of FAO Headquarters in Rome, Italy. The realization of this manual has been possible thanks to the hard review, compilation and edition work of Nadia Scialabba, Natural Resources officer (NRC) and Ilka Gomez and Lisa Thivant, members of the TECA Team. Special thanks are due to the International Federation of Organic Agriculture Movements (IFOAM), the Research Institute of Organic

Agriculture (FiBL) and the International Institute for Rural Reconstruction (IIRR) for their valuable documents and publications on organic farming for smallholder farmers.

This is the most comprehensive book to be written on the subject of fetal MRI. It provides a practical

hands-on approach to the use of state-of-the-art MRI techniques and the optimization of sequences. Fetal pathological conditions and methods of prenatal MRI diagnosis are discussed by organ system, and the available literature is reviewed.

Interpretation of findings and potential artifacts are thoroughly considered with the aid of numerous high-quality illustrations. In addition, the implications of fetal MRI are explored from the medico-legal and ethical points of view. This book will serve as a detailed resource for radiologists, obstetricians, neonatologists, geneticists, and any practitioner wanting to gain an in-depth understanding of fetal

MRI technology and applications. In addition, it will provide a reference source for technologists, researchers, students, and those who are implementing a fetal MRI service in their own facility.

Designed for health care professionals in multiple disciplines and clinical settings, this comprehensive, evidence-based wound care text provides basic and advanced information on wound healing and therapies and emphasizes clinical decision-making. The text integrates the latest scientific findings with principles of good

wound care and provides a complete set of current, evidence-based practices. This edition features a new chapter on wound pain management and a chapter showing how to use negative pressure therapy on many types of hard-to-heal wounds. Technological advances covered include ultrasound for wound debridement, laser treatments, and a single-patient-use disposable device for delivering pulsed radio frequency.

This reference book, which is the second volume of Targeting Oxidative Stress in Cancer, explores

oxidative stress as the potential therapeutic target for cancer therapy. The initial chapters discuss the molecular mechanisms of oxidative stress and its effects on different signaling pathways. Subsequently, the sections examine the impact of redox signaling on tumor cell proliferation and consider the therapeutic potential of dietary phytochemicals and nutraceuticals in reactive oxygen species (ROS)-induced cancer. In turn, it examines the evidence supporting the use of Vitamin C in cancer management, before presenting various synthetic and natural compounds that have therapeutic implications for oxidative stress-induced cancer. It also

explores the correlation between non-coding RNA and oxidative stress. Furthermore, the book summarizes the role of stem cells in ROS-induced cancer therapy and reviews the therapeutic applications of nanoparticles to alter redox haemostasis in cancer cells. Lastly, it explores heat-shock proteins, ubiquitin ligases, and probiotics as potential therapeutic agents in ROS-mediated cancer. This book is a useful resource for basic and translational scientists as well as clinicians interested in the field of oxidative stress and cancer therapy.

The Early Embryology of the Chick Elsevier Health Sciences On the Origin of Form presents a new account of evolution and the origin of life based on the premise that the body form of any species is encoded not in the DNA but in the patterned structure of the primordial germ plasm--the universal predecessor of the egg. Two hundred years after Johann von Goethe's Faustian quest for the Urform, the archetypal design

underlying all living form, comes the recent discovery that organic forms are derived from a unique, self-organized, pre-embryonic structure. This explanation of evolution is an alternative to the now widely questioned Neo-Darwinist theory of natural selection of random mutations. This new model is based on known, relatively uncomplicated scientific principles and is easily accessible to the interested layman. Included are sixty-four pages of illustrations that support this new theory. For additional information, please visit www.ontheoriginofform.com.

Providing expert coverage of all major events in early embryogenesis and the organogenesis of specific systems, and supplemented with representative clinical syndromes, *Principles of Developmental Genetics, Second Edition* discusses the processes of normal development in embryonic and prenatal animals, including humans. The new edition of this classic work supports clinical researchers developing future therapies with its all-new coverage of systems biology, stem cell biology, new technologies, and clinical disorders. A crystal-clear layout, exceptional full-color design, and bulleted

summaries of major takeaways and clinical pathways assist comprehension and readability of the highly complex content. All-new coverage of systems biology and stem cell biology in context of evolving technologies places the work squarely on the modern sciences. Chapters are complemented with a bulleted summary for easy digestion of the

major points, with a clinical summary for therapeutic application. Clinical highlights provides a bridge between basic developmental biology and clinical sciences in embryonic and prenatal syndromes. *Foods of Plant Origin*
