The woman next to you in the coffee shop, typing madly on her laptop, just might be determining the ending to next year's block-buster film or how quickly the hottest new PDA hits store shelves. In homes, dorm rooms, waiting rooms, planes and trains around the world, millions of people are exercising enormous influence on what we buy, even though they have no official connection to those products and services. Who are they? What motivates them? Marketing experts Jackie Huba and Ben McConnell explore the ramifications of social media in *Citizen Marketers*. As everyday people increasingly create content on behalf of companies, brands or products, they are collaborating with others just like themselves and forming ever-growing communities of enthusiasts and evangelists. From the rough to the sophisticated, the "user-generated

media" of blogs, online bulletin boards, podcasts, photos, songs, and animations are influencing companies' customer relationships, product design, and marketing campaigns, whether they participate willingly or not.

Edited by Emanuel F. Hammer, New York University, New York, New York. (With 14 Contributors) On its way to becoming the classic in the field of projective drawings, this book provides a grounding in fundamentals and goes on to consider differential diagnosis, appraisal of psychodynamics, conflict and defense, psychological resources as treatment potentials and projective drawing usage in therapy. In addition to Buck's H-T-P Techniques and Machover's Draw-A-Person Test, it also includes the Draw-A-Family Procedure, Harrower's Unpleasant Concept Test, Kinget's Drawing Completion Test, The Draw-A-

Person-In-The-Rain Test which elicits clues to the self-concept under conditions of environmental stress, the Draw-An-Animal Concept used to disclose the biological side of the biosocial coin, the Eight Card Redrawing Test which delves into the deepest layers of the subject's psychosexual identification, and free doodles.

School refusal affects up to 5% of children and is a complex and stressful issue for the child, their family and school. The more time a child is away from school, the more difficult it is for the child to resume normal school life. If school refusal becomes an ongoing issue it can negatively impact the child's social and educational development.

Psychologist Joanne Garfi spends most of her working life assisting parents, teachers, school counsellors, caseworkers, and community policing officers on how best to deal with school refusal. Now her experiences and expertise are available in this easy-to-read practical book. *Overcoming School Refusal* helps readers understand this complex issue by explaining exactly what school refusal is and provides them with a range of strategies they can use to assist children in returning to school. Areas covered include: • types of school refusers • why children refuse to go to school • symptoms • short term and long term consequences • accurate assessment • treatment options • what parents can do • what schools can do • dealing with anxious high achievers •

how to help children on the autism spectrum with school refusal

Understanding distributed computing is not an easy task. This is due to the many facets of uncertainty one has to cope with and master in order to produce correct distributed software. Considering the uncertainty created by asynchrony and process crash failures in the context of message-passing systems, the book focuses on the main abstractions that one has to understand and master in order to be able to produce software with guaranteed properties. These fundamental abstractions are communication abstractions that allow the processes to communicate consistently (namely the register abstraction and the reliable broadcast abstraction), and the consensus agreement abstractions that allows them to cooperate despite failures. As they give a precise meaning to the words "communicate" and "agree" despite asynchrony and failures, these abstractions allow distributed programs to be designed with properties that can be stated and proved. Impossibility results are associated with these abstractions. Hence, in order to circumvent these impossibilities, the book relies on the failure detector approach, and, consequently, that approach to fault-tolerance is central to the book. Table of Contents: List of Figures / The Atomic Register Abstraction / Implementing an Atomic Register in a Crash-Prone Asynchronous System / The Uniform Reliable Broadcast Abstraction / Uniform Reliable Broadcast Abstraction Despite Unreliable Channels / The Consensus Abstraction / Consensus Algorithms for Asynchronous Systems Enriched with Various Failure Detectors / Constructing Failure Detectors

Understanding distributed computing is not an easy task. This is due to the many facets of uncertainty one has to cope with and master in order to produce correct distributed software. A previous book *Communication and Agreement Abstraction for Fault-tolerant Asynchronous Distributed Systems* (published by Morgan & Claypool, 2010) was devoted to the problems created by crash failures in asynchronous message-passing systems. The present book focuses on the way to cope with the uncertainty created by process failures (crash, omission failures and Byzantine behavior) in synchronous message-passing systems (i.e., systems whose progress is governed by the passage of time). To that end, the book considers

fundamental problems that distributed synchronous processes have to solve. These fundamental problems concern agreement among processes (if processes are unable to agree in one way or another in presence of failures, no non-trivial problem can be solved). They are consensus, interactive consistency, k-set agreement and non-blocking atomic commit. Being able to solve these basic problems efficiently with provable guarantees allows applications designers to give a precise meaning to the words "cooperate" and "agree" despite failures, and write distributed synchronous programs with properties that can be stated and proved. Hence, the aim of the book is to present a comprehensive view of agreement problems, algorithms that solve them and associated computability bounds in synchronous message-passing distributed systems. Table of Contents: List of Figures / Synchronous Model, Failure Models, and Agreement Problems / Consensus and Interactive Consistency in the Crash Failure Model / Expedite Decision in the Crash Failure Model / Simultaneous Consensus Despite Crash Failures / From Consensus to k-Set Agreement / Non-Blocking Atomic Commit in Presence of Crash Failures / k-Set Agreement Despite Omission Failures / Consensus Despite Byzantine Failures / Byzantine Consensus in Enriched Models

Memoirs of the Life and Works of Jean Antoine Houdon Franklin Classics

This edition of the annual publication considers the need to reshape the global architecture of world trade, in order to help strengthen the economies of developing countries and reduce world poverty. The report focuses on four policy areas: the establishment of a development round of WTO negotiations

to reduce trade barriers; global co-operation to expand trade outside the WTO; the adoption of pro-trade development policies by high-income countries; and enacting trade reforms in developing countries. The findings of the report suggest that developing countries could significantly increase their incomes, if all countries progressively implement the proposed trade reforms. This would result in a world with a much higher standard of living, an estimated 300 million people lifted out of poverty by 2015, and a significant increase in the number of children living beyond their fifth birthday throughout the developing world.

Jean-Antoine Houdon (1741-1826) has long been recognized as the greatest European portrait sculptor of the late eighteenth century, flourishing during both the American and French Revolutions as well as during the Directoire and Empire in France. Whether sculpting a head of state, an intellectual, or a young child, Houdon had an uncanny ability to capture the essence of his subject with a characteristic pose or expression. Yet until now, Houdon's exquisite sculptures have never been the subject of a major exhibition. This lavish exhibition catalogue will immediately take its rightful place as the definitive work on Houdon. With more than one hundred color plates and two hundred black and white halftones, Jean-Antoine Houdon: Sculptor of the Enlightenment illustrates every stage of the sculptor's fascinating career, from his early portrayals of Louis XVI and Marie Antoinette to his stunning portraits of American patriots such as George Washington, the Marquis de Lafayette, John Paul Jones, Benjamin

Franklin, and Thomas Jefferson. Indeed the images we hold dear of legendary Enlightenment figures like Diderot, Rousseau, d'Alembert, and Voltaire are based on works by Houdon. More than mere representations, these sculptures provide us fascinating, intimate glimpses into the very core of who these figures were. Houdon's genius animated even his less illustrious subjects, like his portraits of his family and friends, and filled his sculptures of children with delicacy and freshness. Accompanying the images of Houdon's masterworks are four insightful essays that discuss Houdon's views on art (based in part on a newly discovered manuscript written by the artist) as well as his prominence in the highly varied cultures of eighteenth-century France, Germany, and Russia. From aristocrats to revolutionaries, actors to philosophers, Houdon's amazingly vivid portraits constitute the visual record of the Enlightenment and capture the true spirit of a remarkable age. Jean-Antoine Houdon finally gives these gorgeous works their due.

Distributed computing is at the heart of many applications. It arises as soon as one has to solve a problem in terms of entities -- such as processes, peers, processors, nodes, or agents -- that individually have only a partial knowledge of the many input parameters associated with the problem. In particular each entity cooperating towards the common goal cannot have an instantaneous knowledge of the current state of the other entities. Whereas parallel computing is mainly concerned with 'efficiency', and real-time computing is mainly concerned with 'on-time computing', distributed computing is mainly concerned with 'mastering uncertainty' created by issues such as

the multiplicity of control flows, asynchronous communication, unstable behaviors, mobility, and dynamicity. While some distributed algorithms consist of a few lines only, their behavior can be difficult to understand and their properties hard to state and prove. The aim of this book is to present in a comprehensive way the basic notions, concepts, and algorithms of distributed computing when the distributed entities cooperate by sending and receiving messages on top of an asynchronous network. The book is composed of seventeen chapters structured into six parts: distributed graph algorithms, in particular what makes them different from sequential or parallel algorithms; logical time and global states, the core of the book; mutual exclusion and resource allocation; high-level communication abstractions; distributed detection of properties; and distributed shared memory. The author establishes clear objectives per chapter and the content is supported throughout with illustrative examples, summaries, exercises, and annotated bibliographies. This book constitutes an introduction to distributed computing and is suitable for advanced undergraduate students or graduate students in computer science and computer engineering, graduate students in mathematics interested in distributed computing, and practitioners and engineers involved in the design and implementation of distributed applications. The reader should have a basic knowledge of algorithms and operating systems.

Keene on Chess Franklin Classics

Mel Worthington wasn't sure what he'd find when he went over the edge into Fairyland. There he was amazed to discover his mother was revered as a goddess known as the Diamond Queen. Mel has a rightful claim to the throne, but his fierce bodyguard assigned to guide him in this world, has a claim of her own. Riley Evensong knows it's her destiny to rule Eldenfair and is suspicious of this human who's been asked over by the reigning king to help solve a technical problem. A strange social media fad called Flitter has all the young fae enchanted and is causing havoc, but this is only the beginning of the evil spells drifting in from the Other Side. Riley must put aside her resentment of Mel, and Mel must come to terms with his emerging magic so together they can save Fairy tales from becoming warped beyond recognition. Oh, and there's a talking animal side kick, of course.
